

Markdown

What is Markdown?

Markdown is a *lightweight markup language* that you can use to add formatting elements to plaintext text documents. Created *by John Gruber in 2004*, **Markdown** is now one of the world's most popular markup language. Using **Markdown** is different than using a WYSIWYG editor. In an application like Microsoft Word, you click buttons to format words and phrases, and the changes are visible immediately. **Markdown** isn't like that. When you create a **Markdown**-formatted file, you add **Markdown** syntax to the text to indicate which words and phrases should look different.

Why Use Markdown?

- **Markdown** can be used for everything. People use it to create ***websites, documents, notes, books, presentations, email messages, and technical documentation.***
- **Markdown** is portable. Files containing **Markdown**-formatted text can be ***opened using virtually any application.***
- **Markdown** is platform independent. You can create **Markdown**-formatted text on ***any device running any operating system.***
- **Markdown** is future proof. Even if the application you're using stops working at some point in the future, you'll still be able to read your **Markdown**-formatted text using a text editing application.
- **Markdown** is everywhere. *Websites like Reddit and GitHub* support **Markdown**, and lots of desktop and web-based applications support it.

Recommended Markdown Applications

- Mac: MacDown, iA Writer, or Marked 2
- Windows: ghostwriter or Markdown Monster
- Linux: ReText or ghostwriter

Notes Taking Apps

- Linux
 - Joplin
 - Obsidian
- Windows
 - Typora
 - Notion
- macOS
 - Ulysses
 - Craft
