Open-source software means that the code used to build the program is open and free for everyone to see, change and improve. Open-source software is not just getting free software, but also a place where people from all over the world work together to make technology better. Nowadays open-source software is recognized by big companies such as Microsoft. It was very surprising to know how many free software alternatives we have like VLC, LibreOffice or Blender and we could use it for free instead of paying for the proprietary software. As a Network administrator student, I think this knowledge will be very useful in the future.

...

I agree that open-source software is more than just being free because it gives people the ability to work together and improve software. I also found it interesting how many open-source programs are available, especially since some of them can replace software that normally costs money. As a fellow Network Administration student, I think understanding open source will be useful in the future because Linux and other open-source tools are important in networking. It was also interesting to see how a project like Linux grew from a small project into something used by many large companies all due to collaboration.
